SUMMARY. Objective. A bibliometric study of peer-reviewed scientific publications on atypical antipsychotic drugs (AADs) from Italy is herein presented. **Methods.** We selected the documents from Scopus database. We applied several bibliometric indicators of production and dispersion, including Price's Law about the increase of scientific literature, and Bradford's Law. We also calculated the participation index across different countries. The bibliometric data have also been correlated with some social and health data sourcing in Italy, such as total *per capita* expenditure on health and gross domestic expenditure. **Results.** A total of 2949 original documents were published within the period 1972-2015. Our results state fulfilment of Price's Law, with scientific production showing exponential growth ($r=0.901$, as against an $r=0.838$ after linear adjustment). The drugs most widely studied were clozapine (257 documents), risperidone (179), and olanzapine (172). Stratification into Bradford zones yielded a nucleus represented by the *Journal of Clinical Psychopharmacology* and *Rivista di Psichiatria* (58 articles, each one). A total of 1091 different journals were evaluated. **Conclusions.** The publications on AADs in Italy have undergone exponential growth over the studied period, which is in line with the progressively burgeoning on novel AAD releases. No evidence of saturation point was observed.

KEY WORDS: atypical antipsychotic drugs, bibliometry, schizophrenia, Italy.

RIASSUNTO. Introduzione. Lo scopo è stato di condurre uno studio bibliometrico delle pubblicazioni scientifiche peer-reviewed sui farmaci antipsicotici atipici (AAD) in Italia. **Metodi.** Sono stati selezionati i documenti rilevanti dal database Scopus. Sono stati impiegati diversi indicatori bibliometrici di produzione e dispersione, inclusa la legge di Price sull'aumento delle letteratura scientifica e la legge di Bradford. Sono anche stati calcolati gli indici di partecipazione per quanto concerne i diversi stati. I dati bibliometrici sono stati anche correlati con alcuni dati italiani sociali e sulla salute, come la spesa totale pro-capite sulla salute e la spesa pubblica totale. **Risultati.** Negli anni 1972-2015 sono stati pubblicati 2949 documenti originali. I risultati del nostro studio hanno soddisfatto la legge di Price, con una produzione scientifica che ha mostrato una crescita esponenziale ($r=0,901$, $r=0,838$ dopo correzione lineare). I farmaci più studiati sono risultati essere la clozapina (257 documenti), il risperidone (179) e l'olanzapina (172). La stratificazione secondo le zone di Bradford ha fatto emergere un nucleo maggiormente rappresentato dal *Journal of Clinical Psychopharmacology* e dalla *Rivista di Psichiatria* (58 articoli ognuno). È stato valutato un totale di 1091 riviste. **Conclusioni.** Le pubblicazioni sugli AAD in Italia hanno mostrato una crescita esponenziale nel periodo studiato, dato in linea con il progressivo impiego e lo studio sull'uscita dei nuovi AAD. Non è stata trovata alcuna evidenza di punto di saturazione.

Bibliometric analysis of atypical antipsychotics in Italy

INTRODUCTION

Schizophrenia is par excellence the prototype of psychiatric disorders. It is a persistent, debilitating and severe mental illness, with an etiopathogenic base not fully understood. According to epidemiological studies, its prevalence fluctuates between 0.5 and 1.0% in the general population¹. The World Health Organization (WHO) classifies this illness among the 10 leading disorders carrying high disability in the adult population².

The main therapeutic pillar for schizophrenia treatment during the last 60 years have been antipsychotic drugs. The first antipsychotics, called classical or typical, have relevant side effects, principally extrapyramidal symptoms (EPS)³. However, after the reintroduction in the United States of clozapine, the research expectations shifted dramatically, and opened the door to the so-called "atypical antipsychotics" (AADs)⁴. The clinical criteria for atypicality include an antipsychotic efficacy at least similar to that of classical agents, altogether with a lower propensity for EPS. The advances achieved in the field of antipsychotic drugs in the past 20 years have been remarkable, with the clinical introduction of numerous AADs (risperidone, olanzapine, quetiapine, ziprasidone, aripiprazole, etc.) (Table 1). These agents have

notably improved the quality of life (QoL) of psychotic patients and have significantly contributed to weakening the stigma surrounding psychiatric pharmacotherapy⁵. Thus, since 1993, with the clinical introduction of the new antipsychotics and, later on, with their authorization for the treatment of bipolar disorder since 2003, research related to these drugs has advanced considerably, and this has undoubtedly translated into a considerable increase in the amount of scientific literature on these drugs – as it has been analyzed, in the specific case of Italy, in this study.

No accurate prevalence or incidence data is available on schizophrenia in Italy⁶. The reasons for this are two-fold. The first is that the expected prevalence (based on studies in other countries and several small regional studies in Italy) is about 4-5/1000, although studies are needed on a much larger population (at least 50,000 individuals) to allow more accurate estimate with an acceptable confidence interval. The second reason is that schizophrenia, unlike other mental health disorders such as most anxiety disorders and unipolar depression (assessed in the ESEMED study [European Study of the Epidemiology of Mental Disorders]), the only epidemiological study of mental disorders carried out in the general population in Italy), cannot be considered reliable as it was performed using non-professional interviewers (with low associated costs); to involve professionals would have been cost prohibitive⁷. Based on international data, in Italy, with an adult population (age ≥ 18 years) roughly above 50 million individuals, it can be estimated that there are around 245,000 people with or who have been affected with a schizophrenic disorder at some point in their lifetime⁸.

In Italy, more than 30 years after the approval of law 180/78, which decentralised treatment of psychiatric patients, and the beginnings of local psychiatric services, the network of local services for mental health care in Italy likely represents, on an international level, a model to be adopted in the development of community interventions⁶. In the last decade, at national and regional levels, the efficiency of the community psychiatric system has been assessed system in terms of level of care provided to patients with psychoses, and in particular, with schizophrenia. However, any judgement regarding the efficacy of mental health services cannot be complete without evaluating the outcomes of interventions, which represents a central but difficult task. In fact, significant positive outcomes, or improvement in health following intervention, are the primary goal of mental health services. Thus, the need for better cost-utilization and resources information about antipsychotics is crucial to gather a more comprehensive picture of the current pharmacological trends and effectiveness of care management of schizophrenia patients.

The use of bibliometric indicators for studying research activity in a specific country or in a particular field is based on the premise that scientific publication is the essential result of such activity⁹. Despite their methodological limitations, bibliometric studies are useful tools for assessing the social and scientific relevance of a given discipline or field¹⁰. Our group has studied, with a bibliometric approach, the evolution of scientific literature in psychiatry by specific research groups, on different psychiatric disorders, on aspects related to the discipline, and on specific therapeutic tools in the field of psychopharmacology¹¹⁻¹⁴. In recent years, we have also analysed the evolution of scientific production on

Table 1. Clinical development of AADs.

AADs	Company	Launch	Country
Clozapine	Wander Laboratories	1972*	Switzerland

*Reintroduced in 1990 in USA and UK after being withdrawn from the market in 1975.

**Commercialized by Astellas in Germany in 1990.

***Marketing authorization was suspended by the European Medicines Agency (EMA) in 1998 and the drug was withdrawn from the market. In 2002, based on new data, the EMA suggested that sertindole could be reintroduced for restricted use, and with extensive ECG monitoring requirement.

AADs in different countries in Asia¹⁵ and Spain¹⁶. Herein, we focused this bibliometric approach on AADs publications sourcing in Italy.

METHODS

Data collection

The database used for the present bibliometric study was Scopus, the largest abstract and citation database of peer-reviewed literature: scientific journals, books and conference proceedings. It covers nearly 22,000 titles from over 5000 publishers, of which 20,000 are peer-reviewed journals in the scientific, technical, medical, and social sciences (including arts and humanities).

Using remote downloading techniques, we selected documents containing, in the AD (author address) section the descriptor *Italy*, and in the TI (title) section, the descriptors *atypic* antipsychotic**, *second-generation antipsychotic**, *clozapine*, *risperidone*, *olanzapine*, *ziprasidone*, *quetiapine*, *sertindole*, *aripiprazole*, *paliperidone*, *amisulpride*, *zotepine*, *asenapine*, *iloperidone*, *lurasidone*, *perospirone* and *blonanserin*, always confining the year of publication to the period 1972-2016. Further descriptors, referring to pharmacological aspects, were not restricted to any field of the database. For the purposes of this study we considered all the original articles, brief articles, reviews, editorials, letters to the editor, etc., and all duplicated documents were eliminated.

Bibliometric indicators

Among the bibliometric indicators of production applied is Price's Law¹⁷. This law, without doubt the indicator most widely used in analysis of the productivity of a specific discipline or a particular country, reflects a fundamental aspect of scientific production, which is its exponential growth. In order to assess whether the growth of scientific production in AADs follows Price's Law of exponential growth, we made a linear adjustment of the data obtained, according to the equation $y=4.491x - 8886$, and another adjustment to an exponential curve, according to the equation $y=1E-69e^{0.081x}$.

Other indicators related to growth of scientific literature are doubling time and annual growth rate. The first is the amount of time required for the subject matter to double its production; and the annual growth rate represents how the magnitude has grown over the previous year, expressed as a percentage. The equation that calculates the doubling time (D) is represented by the following expression:

$$D = \frac{\text{Ln}2}{b}$$

where b represents the constant that relates the rate of growth to the size of the science already acquired. To calculate the annual growth rate, we used the following equation:

$$R = 100 (e^b - 1)$$

As a bibliometric indicator of the dispersion of scientific information we used Bradford's Law. With the aim of revealing the distribution of the scientific literature in a particular discipline, Bradford proposed a model of concentric zones of productivity (Bradford zones) with decreasing density of information¹⁸. Thus, each

zone would contain a similar number of documents, but the number of journals in which these are published would increase on passing from one zone to another. This model permits identification of the journals most widely used or with greatest weight in a given field of scientific production.

As an indicator of the publications' repercussion we used the Impact Factor (IF). This indicator, developed by the Institute for Scientific Information (Philadelphia, PA, USA), is published annually in the *Journal Citation Reports (JCR)* section of the *Science Citation Index (SCI)*. The IF of a journal is calculated on the basis of the number of times this journals is cited in the source journals of the SCI during the two previous years and the total number of articles published by the journal in question in these two years. The JCR lists scientific journals by specific areas, ascribing to each of them their corresponding IF and establishing a ranking of "prestige"¹⁹. We used the IF data of 2015 published in the JCR.

Another indicator included in the present analysis is the national participation index (PI) of Italy for overall scientific production (the ratio of the number of documents generated by Italy and the total number of documents on this topic). This PI has also been compared with global PI in biomedical and health sciences (as well as for Psychiatry and Mental Health area in particular). Likewise, the PI has been correlated with some health data of Italy, such as total *per capita* expenditure on health and gross domestic expenditure. The PI has also been correlated with the corresponding PI for the world's 11 most productive countries during the period 1996-2015. The health data were obtained from The World Bank²⁰ (2014) and World Health Organization Department of Health Statistics and Informatics²¹.

RESULTS

Following studying of the repertoire analyzed, during the period 1972-2015, we gathered 2,949 original documents (articles, reviews, editorials, letters to the editor, etc.) dealing with different aspects related to AADs in Italy. Of these, 257 correspond to clozapine, 179 to risperidone, 172 to olanzapine, 122 to aripiprazole, 101 to quetiapine, 36 to amisulpride, 24 to paliperidone, 22 to ziprasidone, 13 to asenapine 11 to sertindole, 9 to lurasidone, and 2 iloperidone. No document relative to zotepine, blonanserin, and perospirone was found.

As outlined in Figure 1, over the last 40 years there has been a steep increase in the number of publications generated in relation to AADs in Italy at a in line with worldwide trend. The mathematical adjustment to an exponential curve, shown in Figure 1, permits us to obtain a correlation coefficient $r=0.9014$, indicating 9.86% of variance unexplained by this fitting. In contrast, the linear adjustment of the measured values provides an $r=0.8383$, and therefore a percentage of unexplained variance of 16.17%. With these data we can conclude that the repertoire analyzed is more in keeping with an exponential fitting than a linear one, and that the postulates of Price's Law are fulfilled.

To calculate doubling time, the scatter plot in Figure 2 shows the temporal production of publications along the trend line, which was fitted to the equation $y=28.489e^{0.1127x}$, with a correlation coefficient of 0.9268. This production corresponds to 44 years and a doubling time of 6.11 years.

The clinical introduction of the new AADs in different countries of the world, altogether with their authorization for the treatment of bipolar disorder, appears to have con-

Bibliometric analysis of atypical antipsychotics in Italy

Figure 1. Growth of scientific production on AADs in Italy. A linear adjustment of the data was carried out, and a fitting to an exponential curve, in order to check whether production follows Price's Law of exponential growth.
Linear adjustment: $y = 4.491x - 8886$ ($r^2 = 0.838$).
Exponential adjustment: $y = 1E-69e^{0.0814x}$ ($r^2 = 0.901$).

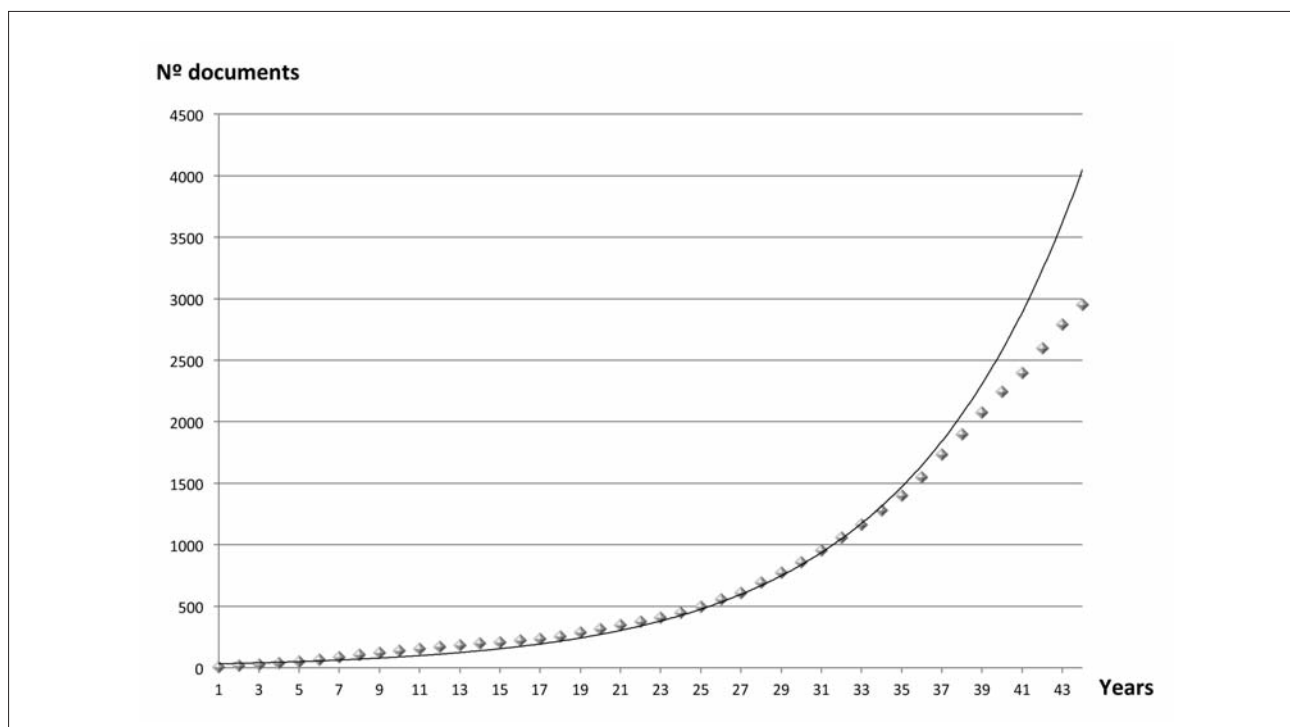

Figure 2. Temporal evolution of number of documents on AADs (44 years).

tributed substantially to the increase in scientific production in the field of AADs in Italy, as can be seen in Figure 3. With effect from 2008, the growth is manifest, due mainly to two drugs, aripiprazole and olanzapine, respectively. Figure 4 illustrates the matter even better. It can be observed that cumulative growth in total scientific production related to AADs in Italy in each five-year period over the previous one even gradually increases. Figure 5 shows the growth, for periods of five years, of the Psychiatry and Mental Health vs. AADs.

As regards the scientific media in which the documents on AADs have been published, we have applied the Bradford's model. The mean number of articles per Bradford zone is 983, though if we discard the last zone, whose accuracy is obviously lower, the mean would be 841. Table 2 shows the division into Bradford's areas of the material under study. A total of 1,091 different journals were involved in the publication of the material analyzed, it should be noted that just over 16% of them are responsible for 50% of documents. The core consists of 38 journals, being those that contain the largest number of articles *Journal of Clinical Psychopharmacology* and *Rivista di Psichiatria* (which is a broadly-read Journal popular among Italian psychiatrists), with a 1.97 both IP, and IF of 3,243 and 0,723 respectively.

The general contribution of Italy science, within this thematic area, represents a global PI of 4.75 with respect to world production in period analyzed. Among the countries generating research on AADs, the most significant, as Table 3 shows, is the United States, whose PI is 27.37, followed by the United Kingdom (PI=7.03), Germany (PI=5.43), Japan (PI=5.18), Canada (PI = 4.17) and France (PI = 4.16). However, if we consider the productivity of these countries in this area in relation to their overall production in the field of Psychiatry and Neurology, only 1 (Spain) of the 11 largest producers in the period 1996-2015, devote a higher percentage of attention to the study of AADs (Figure 6). In the analysis of the correlation between PI and the *per capita* health expenditure of each of the countries with the highest scientific production in health sciences, the distribution obtained is quite similar (Figure 7).

Figure 8 shows the most productive institutions in relation to the material under study. As it can be seen, 50% of total production was generated in the 13 institutions most productive, among which stand out University of Milano, "Alma Mater Studiorum" University of Bologna and University "La Sapienza" of Rome. However, it must be said that we defined the corresponding institution solely based on the information given in the AD field in the Scopus web database.

Figure 3. Number of documents on AADs (1972-2015) and international authorization of different drugs.

Bibliometric analysis of atypical antipsychotics in Italy

*The world's 11 most productive countries in Psychiatry (and Mental Health) and Neurology for the period 1996-2015.

Total documents 1996-2015 in Psychiatry and Mental Health: 544,264 (Scimago Journal & Country Rank).

Total documents in Neurology 1999-2015: 968,287 (Scimago Journal & Country Rank).

DISCUSSION

Bibliometric studies constitute interesting tools for assessing the social and scientific importance of a given discipline over a specific time period. Despite their methodological limitations, these analyses permit an overview of the growth, size and distribution of the scientific literature related to a particular discipline, and the study of the evolution of not only the biomedical speciality, field of specialization or

issue in question, but also the scientific production of an institution, country, author or research group⁹.

Taking into account these premises, the design of the present analysis allows us to make a global assessment of the growth of scientific literature in relation to AADs in Italy. In this regard, it should be stressed how, as Figure 1 shows, the number of scientific publications has undergone exponential growth over the last 44 years, and especially after 1998, without evidence, up to the end of the period studied, of the process of saturation postulated by Price in his theory of expansion of scientific literature¹⁷. This finding is concordant with the results of our earlier studies from other countries of European Unión, such as Spain¹⁶. Precisely, should be noted as positive, that the time of duplication of the AADs about scientific literature is situated in only 6.11 years, which demonstrates the great dynamism that presents this scientific activity in Italy.

To date, there are relatively few observational studies that have analyzed antipsychotic prescription trends in Italy^{22,23}. Moreover, corresponding bibliometric studies on antipsychotics utilizations in schizophrenia patients in Italy are scant, or virtually absent⁶.

This is a compelling issue, especially considering the high morbidity and mortality risks associated with the use of either first- or second-generation antipsychotic compounds. Regrettably, substantial lack of bibliometric studies, prescription and cost-utilization trends of varying psychiatric drugs in Italy in line with corresponding lack of information for general medicine drugs overall, both in comparison with other Western Europe and North American countries²⁴.

The great development of the scientific literature on AADs coincides with its approval for marketing by the US Food and Drug Administration (FDA) and other international regulatory agencies in the treatment bipolar disorder. Since 2004, other AADs such as risperidone, quetiapine, ziprasidone, aripiprazole, and asenapine, etc. have been also approved for the treatment of manic episodes, and olanzapine and aripiprazole for relapse prevention in patients with bipolar disorder. Quetiapine is indicated as monotherapy for the acute treatment of depressive episodes associated with bipolar disorder, and olanzapine-fluoxetine combination for treating treatment-resistant major depressive disorder. Also aripiprazole was approved in 2007 by the FDA for treating treatment-resistant major depression as an add-on to an antidepressant. Finally, AADs are also commonly used (and studied) in numerous off-label indications, such as toxicological psychosis, agitation symptoms, tics, substance abuse disorders, etc.^{25,26}. In this sense, there has been an important upsurge in the five-year period 2002-06, coinciding with the period of official approval of the new antipsychotics, and new indications for AADs (bipolar disorder, depression, autism, etc.). In the individual analysis of the new AADs, risperidone emerges as the agent most widely studied, as shown by the present bibliometric study.

Another aspect of interest in relation to scientific production that we have analyzed is its quality. To this end we used the indicators of impact and excellence of the publications on the topic in question. The fact that such prestigious journals as *European Neuropsychopharmacology* (IF=4.409) or *Progress in Neuro-Psychopharmacology and Biological Psychiatry* (IF=4.361) publish articles on AADs from Italy is an important factor in this regard, which indicates the relevance

**World Health Organization data²¹.

Figure 8. Contribution of different Italian institutions.

(both clinical and social) that this country has acquired in recent years. Moreover, it is noteworthy, as we have said, that, among the 10 publications most widely used in Italy for the international divulgation on AADs research, 5 are in the ranking of the most relevant in the field of Psychiatry (IF >2) (JCR 2015).

During the two last decades, there has been a notable increase in scientific production in the area of Psychiatry and Neurology in Italy (Figure 5), with this percentage even higher in AADs, at the height of other biomedical disciplines (Table 4) where ranges from the 5th to 8th position. As we have shown in recent studies^{15,16}, research scientific on AADs is one of the fields experiencing faster growth with in psychiatry. Similarly, other authors, using bibliometric tools, have reported that the research activity in the field of schizophrenia is superior to that of other psychiatric fields²⁷. These authors also suggest that the attraction of research on schizophrenia may have been positively affected by the clinical perception of the greater seriousness of the illness compared to other psychiatric pathologies. Moreover, Theander

*Data Scimago Journal & Country Rank (1996-2015).
PI (Participation Index)

and Wetterberg²⁸ report that the number of references on schizophrenia in Medline has followed the general increase of medical publications, which accounts for 0.42% compared to the total medical literature in the period studied.

The two major Anglophone countries, United States and United Kingdom, head the ranking of producer countries and between them generate over a third of total scientific production in this field (34.39%). The fact that in these two countries are home to the pharmaceutical companies responsible for the development of AADs [olanzapine (Eli Lilly, USA), risperidone and paliperidone (Janssen Pharmaceutica, USA), quetiapine (AstraZeneca, UK), ziprasidone (Pfizer, USA), and aripiprazole (Bristol-Myers Squibb/Otsuka Pharmaceutical Co., USA/Japan)] may help to explain this high PI.

Table 3 shows the data from the 11 most productive countries in the Psychiatry & Mental Health and Neurology discipline and compares them with productivity in the specific field of AADs. It is worthy of note how some countries, such as Germany, Canada, and Italy sit near the top of the ranking for AADs production (Table 4), reflecting the special interest of these countries in research into these drugs. Other countries, such as the United States and United Kingdom maintain rates of productivity in AADs research that are in proportion with their global index for Psychiatry and Neurology. Finally, we must highlight countries, such as Spain, where the ratio of research on AADs is higher than in these areas of knowledge (Figure 6), as we have shown in a recent publication¹⁶.

The correlation of scientific production in AADs with the *per capita* health expenditure of each country, shown in Figure 8, offers us a parallel view of this phenomenon; in general, there is confirmation of the notion that the higher the spending on health, the greater the research production. In this regard, it should be made clear that a country's scientific production in a given field tends to reflect a science research and development policy begun some years prior to the period analyzed, and is not the fruit of particular economic circumstances^{12,13}. The correlation analysis between scientific production in AADs and the gross domestic in

Bibliometric analysis of atypical antipsychotics in Italy

health expenditure located to Netherlands, Australia and Canada at the last three positions.

According to the 2015 OECD Health Statistics, covering the period 1960 to 2014, providing comparative analyses on health status, risk factors to health, health care resources and utilisation as well as health expenditure and financing, Italy performances set in the lower-tier level compared with other 33 countries appraised by the OECD²⁹. In 2013, per capita health spending in Italy dropped by 3.5% in real terms - the third year in succession that health expenditure has fallen in real terms. Preliminary estimates point to a further contraction of 1.4% in 2014. Both public and private health spending have shown continuous falls since 2011. As a result, per capita spending on health in Italy remains at a level below that prior to the economic crisis. A number of cost-containment measures have been taken in the wake of the economic crisis to reduce public spending on health. Cuts in pharmaceutical spending, which were already targeted prior to the crisis, have contributed to the overall fall. The share of the generic market has increased, although it remains relatively low in Italy. In 2010: a 12.5% reduction in the retail price of generic drugs was brought in while the following year saw maximum reimbursement prices for generics established in line with prices in Germany, UK, France and Spain²⁹.

Health spending in Italy (excluding investment expenditure in the health sector) was 8.8% of GDP in 2013, slightly below the OECD average of 8.9%. This has increased by 1 percentage point since 2003, mainly because of slow growth in GDP over this ten-year period. The share of the economy allocated to health spending is similar to Spain, Portugal and Greece, but well below the levels of France and Germany (10.9% and 11.0% respectively). The share of government spending in Italy as a share of total spending on health has remained relatively constant over the last decade at around 77%. This is slightly above the OECD average of 73%. Among OECD countries, only the United States and Chile report public spending on health below 50%. Although out-of-pocket spending at 22% of health spending has not increased in recent years, it remains relatively high compared with other western European countries such as France (7%), Germany (14%) and United Kingdom (10%), although still well below some other southern European countries such as Greece (31%) and Portugal (28%). In per capita terms (adjusted for different price levels using economy-wide purchasing power parities), Italy spent USD 3077 per head in 2013. This compares with an OECD average of USD 3453²⁹.

Previous bibliometric studies have drawn attention to a series of limitations characteristic of this approach³⁰. It is obvious, for example, that the international scientific production in a particular field, such as AADs in this case, is much more extensive (many journals or contributions made to scientific conferences and meetings are not indexed in the usual databases). We can also cite the lack of standardization of the name of the authors, or those derived from the incorrect use of methodological filters³¹.

Nevertheless, the recognized quality of the publications included in the databases employed in the present study, which collects not only articles written in English but also in other languages, and their coverage mean that the documents selected constitute a more than representative sample of the international research on the area in question. By way of con-

clusion, it can be asserted that, despite the limitations characteristic of bibliometric studies, and thanks to the design of this study, we have been able to offer a picture of the representativeness and evolution of international research on AADs in Italy, observing the parameters of quality and dissemination most commonly employed at an international level. Research in this field will possibly continue to grow in the coming years, bearing in mind that the ideal antipsychotic drug has not yet been found⁵ and that etiopathogeny of schizophrenia is still, in its majority, unknown. Besides, AADs have, and will continue to have, an ever-expanding range of clinical indications, both within the psychiatric ambit and outside it, to judge from the promising results obtained for the different pathologies with which they have been studied; in consequence, scientific production in relation to these drugs will certainly continue to be abundant, as is happening with the prescription patterns of AADs in this region.

Conflict of interest: the authors have declared no conflict of interest.
